

ULTRASOUND IN OBSTETRICS AND GYNAECOLOGY

Aleksandra Novakov Mikic, MD, PhD

Clinic of gynaecology and obstetrics

Clinical Centre of Vojvodina Novi Sad

At the workshop "Ultrasound in Obstetrics and Gynaecology", the attending students will be able to see the relevant exams performed in gynaecology (normal findings, ovarian cysts, hyperplastic endometrium, uterine myomas, etc), as well as in obstetrics (normal findings in different gestations, screening for chromosomal abnormalities in the first trimester, morphological anomalies, Doppler flows through various fetal and placental blood vessels, etc).

The students will be shown the scans, but will have the opportunity to try to scan themselves, thus being able to get the real feel of the importance of proper training and adequate structure of the examination.

The leaflet with the normal findings of the scans in the first trimester of pregnancy as well as the second trimester of the pregnancy will be provided for each attendant.
